

LinkedIn Agent Workflow

Hey! Glad to connect with you. I am Abhijay, a Harvard MBA and product manager at Google, USA.

Job hunting is hard, hence I wrote this guide for you.

First things first, stay in touch with me on my [LinkedIn](#). I have about 66K followers at the time of this document, so make sure you join my network to get job opportunity updates.

Next, watch this [video](#) on how to setup this n8n agent.

To directly receive tips on upskilling in AI for free sign up for [my action letter](#) to get the latest tips on AI. You can also access previous AI prompts for free here:

I do this for free, so it would mean the world to me if you comment on the post that you have received it

What This Workflow Does

This workflow automates the process of:

- Generating a Google Boolean search string for LinkedIn profiles based on a job description.
- Scraping Google search results for LinkedIn profiles.
- Extracting names, company domains, and context from those profiles.
- Finding email addresses using Hunter.io.
- Generating personalized cold emails.
- Saving all results to a Google Sheet and optionally drafting emails in Gmail.

Prerequisites

1. n8n Account: Sign up on n8n [here](#).
2. API Keys & Accounts:
 - OpenAI API key (for ChatGPT).
 - Google account with access to Google Sheets and Gmail.
 - Hunter.io account and API key.
 - Chrome browser with the "Cookie-Editor" extension (for Google search authentication).

Step-by-Step Setup

1. Connect Your Accounts

- OpenAI: In n8n, go to "Credentials" and add your OpenAI API key.
- Google Sheets & Gmail: Add your Google account credentials for both Sheets and Gmail.

- Hunter.io: Add your Hunter.io API key in n8n credentials.

2. Prepare Google Search Authentication

- Install the [Cookie-Editor Chrome extension](#).
- Do a Google search manually, open the extension, and export your cookies as a header string.
- In the “Google Boolean Search” node, edit the HTTP Header Auth credential and paste your cookie string under the “cookie” value.

3. Configure the Workflow

- Open the workflow in the n8n editor.
- Review the sticky notes in the workflow for extra tips and context.
- Make sure all credential nodes (OpenAI, Google Sheets, Gmail, Hunter) are connected to your accounts.

4. How to Use

1. Trigger the Workflow: The workflow starts when you send a chat message (job description) to the “When chat message received” node.
2. Boolean Search Generation: The workflow uses OpenAI to create a Google Boolean search string for LinkedIn profiles.
3. Google Search: It performs a Google search using your authenticated session.
4. Profile Extraction: The workflow extracts LinkedIn URLs and context from the search results.
5. Contact Details: It uses OpenAI to extract names, company domains, and context.
6. Email Finding: Hunter.io is used to find email addresses for the extracted profiles.
7. Personalized Email Generation: OpenAI generates a personalized cold email for each contact.
8. Save Results: All data is appended to a new Google Sheet.
9. Draft Email (Optional): A draft email is created in Gmail for each contact.

5. Customization

- Number of Results: In the “If desired results not reached” node, you can change the number (default is 50) to control how many profiles you want to process.
- Sender Information: Update the sender’s background in the “Personalized Cold-Email Generator” node if needed.

6. Running the Workflow

- Activate the workflow in n8n.
- Send a job description to the chat trigger (or run the workflow manually).
- Check your Google Sheet for results and your Gmail drafts for generated emails.

Troubleshooting

- If you get errors about authentication, double-check your credentials and cookie string.
 - If Google search returns no results, make sure your cookie is up to date and you’re not being rate-limited.
 - For any API errors, ensure your API keys are valid and have enough quota.
-

Tips

- You can adjust the workflow to fetch more or fewer results by changing the loop limit.
- Review the sticky notes in the workflow for extra context and setup help.
- Always keep your API keys and cookies secure.

I just did it and it worked in the editing environment. Here's what I did. Looking back at the instructions it does say to do this, but I didn't realize the header auth credential and cookie value were two steps (two value fields to paste/update):

If Google Boolean Search is not working:

"In the "Google Boolean Search" node, edit the HTTP Header Auth credential and paste your cookie string under the "cookie" value."

- Grabbed a new cookie
- Added it to the Header Auth Credentials section

Header Auth account

Name

Cookie

Value

.....

To send multiple headers, use a "Custom Auth" credential instead

ⓘ Enterprise plan users can pull in credentials from external vaults. [More info](#)

- Added it again to the Header parameters section:
